## CS559-B HW1

Due: Feb. 25th, 2020

Problem 1 (10pt): Independence and un-correlation

(1) (5pt) Suppose X and Y are two continuous random variables, show that if X and Y are independent, then they are uncorrelated.

(2) (5pt) Suppose X and Y are uncorrelated, can we conclude X and Y are independent? If so, prove it, otherwise, give one counterexample. (Hint: consider  $X \sim Uniform[-1,1]$  and  $Y = X^2$ )

**Problem 2 (15pt):** [Minimum Error Rate Decision] Let  $\omega_{max}(x)$  be state of nature for which  $P(\omega_{max}|x) \geq P(\omega_i|x)$  for all  $i = 1, \ldots, c$ .

- (1) (5pt) Show that  $P(\omega_{max}|x) \geq \frac{1}{c}$
- (2) (5pt) Show that for minimum-error-rate decision rule, the average probability of error is given by

$$P(error) = 1 - \int P(\omega_{max}|x)p(x)dx$$

(3) (5pt) Show that  $P(error) \leq \frac{c-1}{c}$ 

**Problem 3 (10pt):** [Likelihood Ratio] Suppose we consider two category classification, the class conditionals are assumed to be Gaussian, i.e.,  $p(x|\omega_1) = N(4,1)$  and  $p(x|\omega_2) = N(8,1)$ , based on prior knowledge, we have  $P(\omega_2) = \frac{1}{4}$ . We do not penalize for correct classification, while for misclassification, we put 1 unit penalty for misclassifying  $\omega_1$  to  $\omega_2$  and put 3 unit for misclassifying  $\omega_2$  to  $\omega_1$ . Derive the bayesian decision rule using likelihood ratio.

**Problem 4 (15pt):** [Minimum Risk, Reject Option] In many machine learning applications, one has the option either to assign the pattern to one of c classes, or to reject it as being unrecognizable. If the cost for reject is not too high, rejection may be a desirable action. Let

$$\lambda(\alpha_i|\omega_j) = \begin{cases} 0, & i = j \text{ and } i, j = 1, \dots, c \\ \lambda_r, & i = c + 1 \\ \lambda_s, & \text{otherwise} \end{cases}$$

where  $\lambda_r$  is the loss incurred for choosing the (c+1)-th action, rejection, and  $\lambda_s$  is the loss incurred for making any substitution error.

- (1) (5pt) Derive the decision rule with minimum risk.
- (2) (5pt) What happens if  $\lambda_r = 0$ ?
- (3) (5pt) What happens if  $\lambda_r > \lambda_s$ ?

Problem 5 (25pt): [Maximum Likelihood Estimation (MLE)] A general representation of a

exponential family is given by the following probability density:

$$p(x|\eta) = h(x) \exp\{\eta^T T(x) - A(\eta)\}\$$

- $\eta$  is natural parameter.
- h(x) is the base density which ensures x is in right space.
- T(x) is the sufficient statistics.
- $A(\eta)$  is the log normalizer which is determined by T(x) and h(x).
- exp(.) represents the exponential function.
- (1) (5pt) Write down the expression of  $A(\eta)$  in terms of T(x) and h(x).
- (2) (10pt) Show that  $\frac{\partial}{\partial \eta} A(\eta) = E_{\eta} T(x)$  where  $E_{\eta}(.)$  is the expectation w.r.t  $p(x|\eta)$ .
- (3) (10pt) Suppose we have n i.i.d samples  $x_1, x_2, \ldots, x_n$ , derive the maximum likelihood estimator for  $\eta$ . (You may use the results from part(b) to obtain your final answer)

**Problem 6 (25pt):** [Logistic Regression, MLE] In this problem, you need to use MLE to derive and build a logistic regression classifier (suppose the target/response  $y \in \{0, 1\}$ ):

- (1) (5pt) Suppose the classifier is  $y = x^T \theta$ , where  $\theta$  contains the weight as well as bias parameters. The log-likelihood function is  $LL(\theta)$ , what is  $\frac{\partial LL(\theta)}{\partial \theta}$ ?
- (2) (20pt) Write the codes to build and train the classifier on Iris plant dataset (https://archive.ics.uci.edu/ml/datasets/iris). The iris dataset contains 150 samples with 4 features for 3 classes. To simplify the problem, we only consider: (a) two classes, i.e., virginica and non-virginica; (b) The first 2 types of features for training, i.e., sepal length and sepal width. Based on these simplified settings, train the model using gradient descent. Please show the classification results. (Note that (1) you could split the iris dataset into train/test set. (2) You could visualize the results by showing the trained classifier overlaid on the train/test data. (3) You could tune several hyperparameters, e.g., learning rate, weight initialization method etc, to see their effects. (3) You could use sklearn or other packages to load and process the data, but you can not use the package to train the model).
